

DELAVIRDINE TABLET FORMULATIONBACKGROUND OF THE INVENTION**Cross-Reference to Related Applications**

503  
B2 5 This application claims the benefit of US provisional application Serial No. 60/088,960 filed 11 June 1998, under 35 USC §119(e)(i).

1. Field of the Invention

The present invention is a tablet formulation which reduces the rate of precipitation of a rapidly precipitating drug and improves dissolution.

2. Description of the Related Art

10 US Patent 5,563,142 (EXAMPLE 105) discloses delavirdine.

International Publication WO95/28398 based on PCT patent application PCT/US95/02166 discloses delavirdine mesylate in two crystal forms "S" and "T".

15 US Patent 5,358,941 discloses a compressed tablet formulation comprising about 0.5 to 40% active ingredient, about 10-80% anhydrous lactose, about 5 to 50% by weight of microcrystalline cellulose, about 0.5 to 10% by weight of croscarmallose sodium and about 0.1 to 5% magnesium stearate. The pharmaceutical tablet formulation of the present invention does not require lactose.

20 Patent EP 283925 discloses utilization of solvent-based polymers under action of high shearing forces so that precipitation is divided into smallest particles to purify resorbable polyester products. The claimed invention does not co-precipitate polymers in any solvent system with the rapidly precipitating drug prior to formulation with other ingredients, but relies only on close proximity of the dry binder or superdisintegrant with the rapidly precipitating drug in a conventional compressed tablet dosage form.

25 *International Journal of Pharmaceutics*, 154, 59-66 (1997) discloses the utilization of HPMC, HPC and PVP in a liquid system at various polymer ratios with intent to delay precipitation. Methods discussed include preparation of solid dispersions either by the co-precipitation method or grinding method to improve dissolution properties. The claimed invention utilizes conventional direct compression 30 method of tablet formulation and does not utilize any solid dispersion techniques such as co-precipitation via solvent use or grinding to achieve co-precipitation.

The Handbook of Drug Excipients, 2<sup>nd</sup>. Ed., edited by A. Wade and P. J. Weller. 1994, page 141, and many other pharmaceutical references, describe the common use of superdisintegrants such as croscarmellose sodium are used to aid tablet 35 disintegration typically in the amount of 1-2% and not more than 5% of the formulation. Higher amounts are not used or recommended due to gelation of the

croscarmellose sodium forming a loose matrix which is known to impede dissolution of many drug compounds. The present invention uses greater than 6% croscarmellose sodium.

The Handbook of Drug Excipients, 2<sup>nd</sup>. Ed., edited by A. Wade and P. J. Weller. 1994, pages 223, 229 and 392, and many other pharmaceutical references, describe the common use of water soluble polymers such as HPMC, HPC-L, and PVP as binders, either as wet binders or dry binders, in immediate and sustained release tablet formulations. For non-sustained release applications, not more than 5% is used of these binders. Higher amounts are not recommended due to impedance of the dissolution rate for many drugs. Amounts higher than 5% of especially HPMC are commonly used only for sustained release dosage forms, and are generally of high molecular weight grades. In the present invention, however, the binder includes use at levels of greater than 5%.

US Patent 5,225,197 discloses a chewable tablet formulation. The present invention is not a chewable tablet.

JP 84-185584 discloses the utilization of HPC, PVP and other binders together with difficulty soluble drugs by use of heat. The claimed invention does not use heat.

#### SUMMARY OF INVENTION

Disclosed is a non-sustained release pharmaceutical tablet composition which comprises: a rapidly precipitating drug in an amount from about 5 to about 60%, microcrystalline cellulose and at least one member selected from the group consisting of a binder in an amount of from about 2 to about 25% and a superdisintegrant in an amount from about 6 to about 40% where the rapidly precipitating drug, microcrystalline cellulose, binder and superdisintegrant are mixed and compressed into a tablet without heating, solvent or grinding.

Also disclosed is a non-sustained release pharmaceutical tablet composition which is:

		<u>Amount (from about to about)</u>
	<u>Item</u>	<u>%</u>
30	delavirdine mesylate	10-40
	hydroxypropyl methylcellulose	5-20
	croscarmellose sodium	6-35
	microcrystalline cellulose	10-50
	lactose	0-15
35	colloidal silicon dioxide	0-5
	magnesium stearate	0-5

where the delavirdine mesylate, microcrystalline cellulose, hydroxypropyl methylcellulose and croscarmellose sodium are mixed and compressed into a tablet without heating, solvent or grinding.

#### DETAILED DESCRIPTION OF THE INVENTION

5 The tablets of the present invention require a rapidly precipitating drug (5-60%), microcrystalline cellulose (10-50%), a binder (2-25%) and superdisintegrant (6-40%). While not required, it is often highly desirable to use one or more of the following pharmaceutical ingredients - microcrystalline cellulose (0-50%), lactose (0-80), a flow agent (0-5) and a lubricant (0-5%).

10 A rapidly precipitating drug is a pharmaceutical compound, or its salt form, which when introduced in water, or simulated physiological fluids at body temperature, begins to dissolve fairly rapidly and then begins to rapidly precipitate out of solution within 60 min to a less soluble form which provides a concentration that is less than therapeutic. This precipitation results in slow and incomplete  
15 dissolution. In most cases, the amount precipitating can be up to 90% or greater which leave about 10% or less available for therapeutic activity. It is preferred that the rapidly precipitating drug is a fairly soluble or highly soluble salt form of a poorly soluble free base or free acid drug or an anhydrous form of a poorly soluble free base or free acid drug. The rapidly precipitating drugs are prone to supersaturation as is  
20 known to those skilled in the art. It is preferred that the rapidly precipitating drug be selected from the group consisting of delavirdine mesylate, phenytoin, furosemide, pseudoephedrine, clindamycin hydrochloride, cloridine hydrochloride, diphenhydramine hydrochloride, fluphenazine hydrochloride, griseofulvin, hydromorphone hydrochloride, naloxone hydrochloride, oxytetracycline hydrochloride,  
25 phenylephrine hydrochloride, pheniramine maleate, tetracycline hydrochloride, verapamil hydrochloride, propoxyphene hydrochloride, propoxyphene napsylate, hydrocodine bitartrate, acyclovir sodium, albuterol sulfate, ampicillin sodium; so <sup>DIARY</sup> <sub>SALTS</sub> benzotropine mesylate, benzphetamine hydrochloride, bupivacaine hydrochloride, bupropin hydrochloride, chlorphenamine maleate, chlorpromazine hydrochloride. It is  
30 most preferred that the rapidly precipitating drug is delavirdine mesylate. The rapidly precipitating drug should be present in an amount of about 5 to about 60%, preferably in an amount of about 10 to about 40%.

Delavirdine, 1-[5-methanesulfonamidoindolyl]-4-[3-(1-methylethylamino)-2-pyridinyl]piperazine is known, see US Patent 5,563,142 (EXAMPLE 105).

35 Delavirdine mesylate is also known in two different crystal forms "S" and "T", see,

International Publication WO95/28398 based on PCT patent application  
PCT/US95/02166.

The tablet formulation of the present invention is a non-sustained release pharmaceutical tablet composition which comprises a rapidly precipitating drug in an amount from about 5 to about 60%, microcrystalline cellulose (10-50%) and at least one member selected from the group consisting of a binder in an amount of from about 2 to about 25% and a superdisintegrant in an amount from about 6 to about 40% where the rapidly precipitating drug, microcrystalline cellulose, binder and superdisintegrant are mixed and compressed into a tablet without heating, solvent or grinding. It is preferred that the binder, microcrystalline cellulose and superdisintegrant all be present.

The tablet formulation of the present invention can use a binder. The binder is preferably selected from the group consisting of hydroxypropyl methylcellulose, PVP, hydroxypropyl cellulose, microcrystalline cellulose, hydroxymethylcellulose, carbopol and sodium carboxymethylcellulose; it is more preferred that the binder be selected from the group consisting of hydroxypropyl methylcellulose and more preferably 2910 U.S.P. 3 cps. Also preferred is PVP. It is preferred that the binder be present in an amount of hydroxypropyl methylcellulose of from about 5 to about 20%, PVP from about 2 to about 15%, hydroxypropyl cellulose or hydroxyethylcellulose from about 5 to about 20%, carbopol, methylcellulose, and sodium carboxymethylcellulose from about 3 to about 20%. It is apparent to those skilled in the art that the binders of the present invention are polymeric binders as opposed to non-polymeric binders.

The superdisintegrant is selected from the group consisting of croscarmellose sodium, sodium starch glycolate, L-hydroxypropyl cellulose; it is more preferred that the superdisintegrant be croscarmellose. The superdisintegrant should be present in an amount of from about 6% to about 40%. It is preferred that the superdisintegrant is present in an amount of from about 6 to about 35%; it is more preferred that the superdisintegrant be present in an amount of about 10 to about 30%. This is one of the agents responsible for delaying the precipitation of the rapidly precipitating drug.

The microcrystalline cellulose is not absolutely necessary to prepare the tablet formulation of the present invention. However, it is highly desirable to have it present in most cases. The tablet formulation can use a microcrystalline cellulose diluent.

When present it is preferred that it can be selected from the group consisting of microcrystalline cellulose coarse powder, microcrystalline cellulose medium powder and microcrystalline cellulose 200; it is more preferred that the microcrystalline

cellulose be microcrystalline cellulose N.F. coarse powder. The microcrystalline cellulose should be present in an amount of from about 5% to about 50%. It is preferred that the microcrystalline cellulose be present in an amount of from about 10 to about 50%.

5           The lactose is not absolutely necessary to prepare the tablet formulation of the present invention. However, it is highly desirable to have it present in most cases in an amount up to about 80%. When present it is preferred that it be selected from the group consisting of lactose monohydrate spray process standard, lactose monohydrate, lactose anhydrous, lactose dihydrate, DMV lactose; it is more preferred that the  
10       lactose be N.F. monohydrate spray process standard lactose. The lactose can be present in an amount of from about 0% to about 80%. It is preferred that the lactose be present in an amount of from about 5 to about 20%.

          The flow agent is not absolutely necessary to prepare the tablet formulation of the present invention. However, it is highly desirable to have it present in most  
15       cases. When present it is preferred that it be selected from the group consisting of colloidal silicon dioxide and talc; it is more preferable that the flow agent be selected from the group consisting of colloidal silicon dioxide N.F. When present, the flow agent should be present in an amount up to about 5%. It is preferred that the flow agent be present in an amount of from 0.25 to about 2%.

20           The lubricant is not absolutely necessary to prepare the tablet formulation of the present invention. However, it is highly desirable to have it present in most cases. When present, it is preferred that the lubricant is selected from the group consisting of magnesium stearate and stearic acid; it is more preferred that the lubricant be magnesium stearate. When present, the lubricant should be present in  
25       an amount up to about 5%. It is preferred that the lubricant be present in an amount of 0.25 to about 2%.

          As is known to those skilled art, the tablet can be colored, flavored and/or film coated as is known to those skilled in the art.

          The tablet composition of the present invention is prepared as is known to  
30       those skilled in the art as direct compression. It is preferred to first mix the rapidly precipitating drug with the microcrystalline cellulose very thoroughly by methods well known to those skilled in the art, preferably by use of a high shear mixer. The hydroxypropyl methylcellulose, croscarmellose, lactose, and screened colloidal silicon dioxide are mixed separately, preferably in a high shear mixer, and added to the drug-  
35       microcrystalline cellulose mixture and all the ingredients are thoroughly mixed, preferably in a high shear mixer. The magnesium stearate is screened and added to

the drug mixture and mixed well. The resulting mixture is compressed by methods well known to those skilled in the art to produce tablets containing the desired amount of active pharmaceutical agent. These tablets can then be film coated and polished as is known to those skilled in the art. These tablets comply with applicable U.S.P. and/or F.D.A. requirements/law and are well suited to commercial production and use. Alternatively, but less preferably, the binder can be solvated and used in a wet granulation process.

### DEFINITIONS AND CONVENTIONS

The definitions and explanations below are for the terms as used throughout this entire document including both the specification and the claims.

#### I. DEFINITIONS

Delavirdine refers to 1-[5-methanesulfonamidoindolyl-2-carbonyl]-4-[3-(1-methylethylamino)-2-pyridinyl]piperazine.

Delavirdine mesylate refers to 1-[5-methanesulfonamidoindolyl-2-carbonyl]-4-[3-(1-methylethylamino)-2-pyridinyl]piperazine mesylate salt.

A "rapidly precipitating drug" is a pharmaceutical compound, or its salt form, which when introduced in water, or simulated physiological fluids at body temperature, begins to dissolve fairly rapidly and then begins to rapidly precipitate out of solution within 60 min to a less soluble form which provides a concentration that is less than therapeutic.

All temperatures are in degrees Centigrade.

Pharmaceutically acceptable refers to those properties and/or substances which are acceptable to the patient from a pharmacological/toxicological point of view and to the manufacturing pharmaceutical chemist from a physical/chemical point of view regarding composition, formulation, stability, patient acceptance and bioavailability.

When two or more solids are used in a mixture, they are expressed as weight/weight designated wt/wt or wt.wt.

PVP refers to polyvinylpyrrolidone.

#### EXAMPLES

Without further elaboration, it is believed that one skilled in the art can, using the preceding description, practice the present invention to its fullest extent. The following detailed examples describe how to prepare the various compounds and/or perform the various processes of the invention and are to be construed as merely illustrative, and not limitations of the preceding disclosure in any way whatsoever.

Those skilled in the art will promptly recognize appropriate variations from the procedures both as to reactants and as to reaction conditions and techniques.

**EXAMPLE 1**                      Delavirdine Mesylate 200 mg Tablet Formulation

5	200 mg tablet		
	<u>Item</u>	<u>Amount/tablet</u>	<u>%</u>
	(wt.wt)		
	delavirdine mesylate	200.00 mg	30.2
	microcrystalline cellulose N.F.	198.76 mg	30.0
10	coarse powder		
	lactose NF monohydrate spray	71.29 mg	10.7
	process standard		
	hydroxypropyl methylcellulose	75.00 mg	11.3
	2910 U.S.P. 3 cps		
15	croscarmellose sodium N.F.	110.00 mg	16.6
	Type A		
	colloidal silicon dioxide N.F.	1.50 mg	0.23
	magnesium stearate N.F. powder	5.00 mg	0.76
	food grade-V bolted		

20            The above tablets are manufactured by intensely mixing the delavirdine mesylate and the microcrystalline cellulose in a high shear mixer. Then add and mix the hydroxypropyl methylcellulose, croscarmellose, lactose, and screened colloidal silicon dioxide in high shear mixer. Finally add screened magnesium stearate and lubricate in high shear mixer. The resulting mixture is compressed, filmcoated, and

25            polished as is known to those skilled in the art to give tablets which have about 200 mg of delavirdine mesylate/tablet and comply with U.S.P. and/or F.D.A. requirements.
